

# **Cross Platform Management and Provisioning with the Intel Platform Innovation Framework for EFI**

**Vincent Zimmer**  
**Staff Engineer**  
**Intel SSG**

**Martin Wilde**  
**Senior TME**  
**Intel SSG**

# Agenda

- **Current State of Affairs**
- **EFI solves problems**
- **Framework provides EFI**
- **Employing the Framework**

# Where are we today?

# Today's Provisioning Solutions

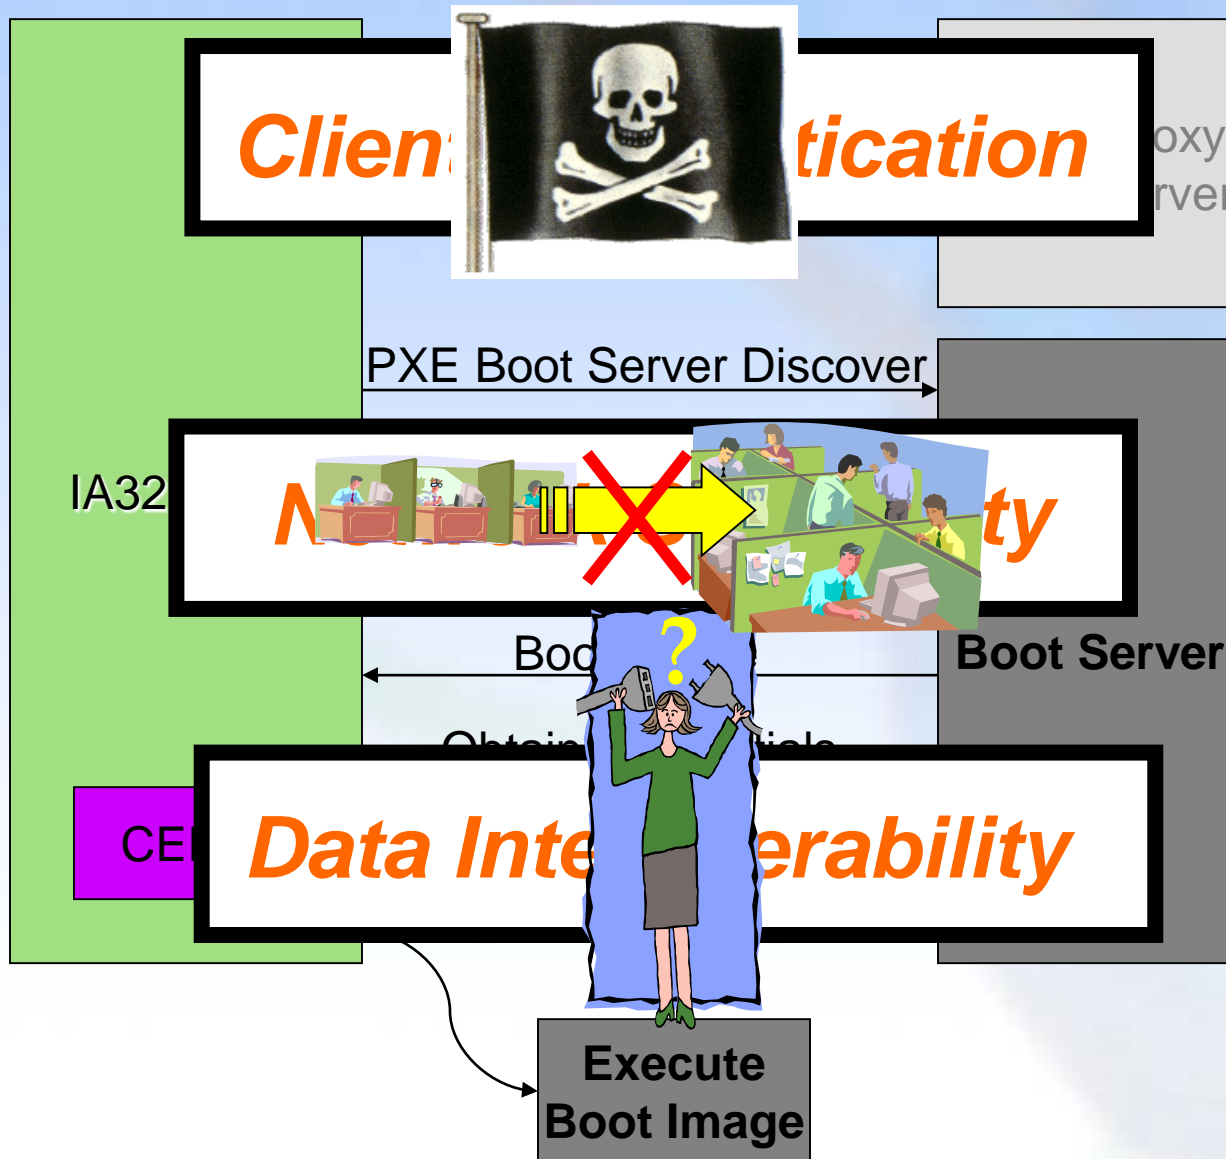

Provisioning  
Server

# What is Today's Technology

- **PXE and BIS**
  - Network boot standard introduced by WfM
- **Homogeneous systems**
  - PC/AT BIOS only
- **Provisioning Agents and Servers**
  - Each is different

# Limitations Today

# Head-aches for IT

- **Lack of standards across platforms**
  - PXE formerly limited to IA32 PC/AT BIOS
  - Setup does not automate well
- **Insufficient security**
  - No authentication of booting system
- **Scalability concerns**
  - Easy to saturate network w/ many clients
- **Limited interoperability**
  - Each infrastructure vendor has different solution

**Current technology limited**

# The Future and EFI

- **Make computers more easily managed by other computers**
- **Enable secure automated management**
- **Scale technology across all platforms**
- **Solve the out-of-box configuration issues**
- **Standardize the technology aspects in the Framework to help reach this end**
  - **Sit tight & details to follow....**

# In an EFI-based world

The Future Begins with EFI Everywhere

# What is the Framework?

- **Pre-EFI Foundation (PEI)**
- **Hardware-specific pre-EFI modules**
- **DXE Foundation**
- **Framework Drivers**
- **Hardware specific drivers and implementations of Architectural Protocols**
- **Platform Drivers**
- **EFI Drivers for adding value to the platform**
- **Compatibility Support Module (CSM)**

# Demo 1 “Basic Blocks” to solve problem

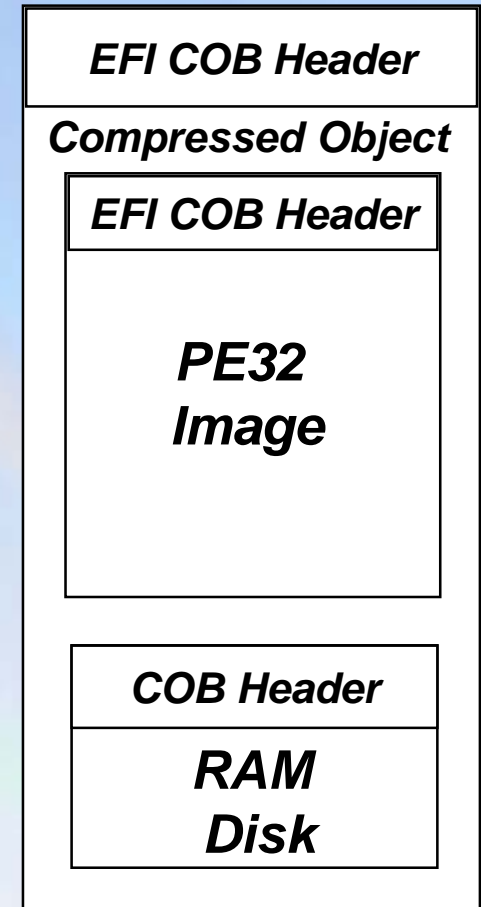

**Move to EFI with the Framework**

# Configuration Building Block

- **EFI Configuration Object (COB)**
  - GUID'ed description of data
- **Means by which for the OEM to add value**
- **Maintain the back-end IT infrastructure**
- **Allow for managing the integrity of the boot image and data**

# Configuration Building block and Provisioning

- **EFI extends network boot program to be a collection of Configuration Objects**
  - OEM provides standard objects
  - OSV provides modules that can be wrapped as standard objects
  - 3<sup>rd</sup> parties can provide value added objects
- **Provisioning software appends EFI Objects together**

# Standardize platform information

- **Configuration objects INTO the client**
  - BIS Certificates
  - ASF Keys
  - iSCSI boot target
- **Configuration objects FROM the client**
  - SMBIOS tables
  - PCI configuration settings
- **Both In and Out**
  - Setup information

**Configuration  
Object**

# Network Scalability

- **Proposing RFCs to the IETF to multicast TFTP to improve scalability.**
  - **TFTP/MTFTP Block Count**
    - Old 22 MB, New  $2^{52}$  MB
  - **Streaming Data**
    - Removing acknowledgements for an approximate 50% performance improvement
  - **Multi-Cast**
    - Managed network saturation
- **This entails software updates to BOTH the client and server software providers**

# Networking API Enhancements

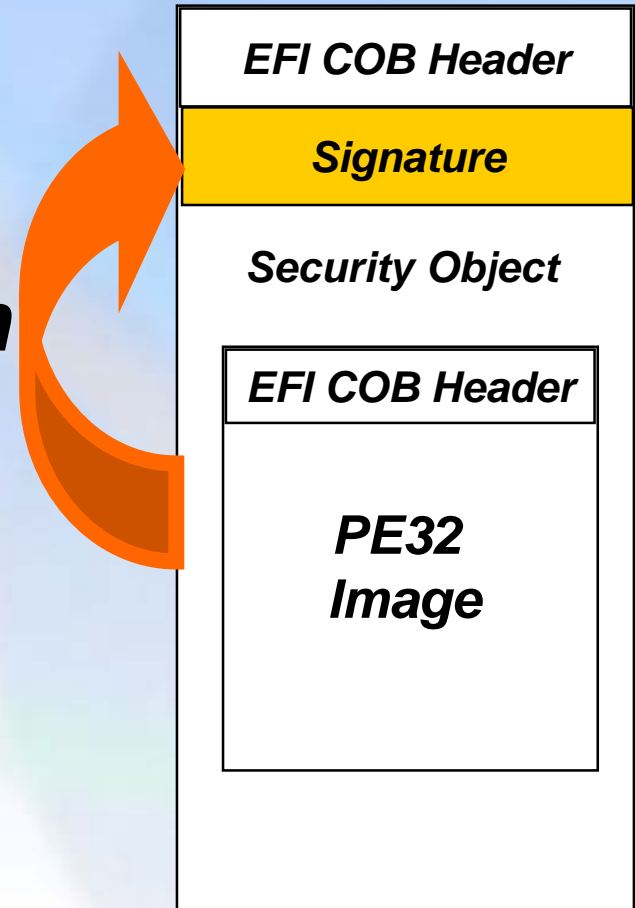

- **Several new pre-boot API's**
- **Ability to now write several services on client**
  - HTTP Server
  - Telnet Server
  - ....
- **Published by client, usable by network boot agents and embedded code**
  - Small, simple, in the flash part

# Security problems to be Solved

- Confirm identity of the client to be configured
- Associate appropriate PXE server with the client machine
- Send the configuration objects to the system with stronger integrity

**Sign**

## Attack Vector - Server

***Successful Exploit***

*Rogue Server*

*Vintage Client*

***EFI Security Violation***

*PXE Server*

*Enhanced Framework Client*

# Demo 2 Rogue attack

# Tomorrow's Solutions

The diagram illustrates a network boot process between a PXE Client (green box) and a Boot Server (grey box). It shows the following sequence of messages: 1. PXE Client sends 'PXE Boot Server Discover' to the Boot Server. 2. Boot Server responds with 'Boot Server Ack'. 3. Boot Server sends 'DHCP ACK' back to the PXE Client. A red 'X' is placed over the 'Boot Server Ack' message, indicating a limitation or error in the current process.

*Client Authentication via EAP*

*Network Scalability via TFTP*

The diagram shows a person holding a question mark, symbolizing a problem or uncertainty. This is positioned between the 'Network Scalability via TFTP' and 'Interoperability via COBs' sections.

*Interoperability via COBs*

**The Framework Removes Limitations**

# Summary

- **Current Technology Limited**
- **The Future Begins with EFI everywhere**
- **Move to EFI with the Framework**
- **The Framework Removes Limitations**

# Call to action

- Platform builders move to Framework for enabling silicon
- Use the feedback
  - <http://www.intel.com/technology/efi>
  - <http://www.intel.com/technology/framework>
- Provisioning and OSVs investigate this technology
- IT investigate this technology

# More Information

| Session   | #    | Day  | Time           | Room |
|---|------|------|----------------|------|
| Intel® Platform Innovation Framework for EFI: Overview, Roadmap and Getting Ready for Next Year | S002 | Tues | 3:00-3:50 PM   | 2010 |
| EFI IA32 and Microsoft  | S003 | Tues | 5:00-5:50 PM   | 2010 |
| Employing the Intel® Platform Innovation Framework for EFI for Mobile Platform Support          | S004 | Wed  | 10:00-10:50 AM | 2010 |
| OEM Firmware Development Using the Intel Platform Innovation Framework for EFI                  | S005 | Wed  | 11:00-11:50 AM | 2010 |

## ***Birds-of-a-Feather Lunch Discussion***

***When: Wednesday 12PM – 1:30PM***

***Where: Level 3 Foyer (Not in the main lunch area)***

***Arrive early – seating is limited***

# Q & A

## Cross-Platform Management and Provisioning on the Intel® Platform Innovation Framework for EFI

# Acronyms

- **ASF – Alert Standard Format**  
[http://www.dmtf.org/standards/standard\\_alert.php](http://www.dmtf.org/standards/standard_alert.php)
- **BIS – Boot Integrity Service**  
<http://www.intel.com/design/security/bis/biswks.htm>
- **CERT – Certificate like X.509**  
<http://www.ietf.org/html.charters/pkix-charter.html>
- **DHCP – Domain Host Controller Protocol**
- **RADIUS – Remote Authentication Dial-In User Service**  
<http://www.faqs.org/rfcs/rfc2138.html>
- **EAP – Extensible Authentication Protocol**  
<http://www.faqs.org/rfcs/rfc2284.html>
- **EFI – Extensible Firmware Interface**  
[http://www.intel.com/technology/efi/main\\_specification.htm](http://www.intel.com/technology/efi/main_specification.htm)
- **802.1x – Port Based Network Access Control**  
<http://www.ieee802.org/1/pages/802.1x.html>
- **PXE – Preboot eXecution Environment**  
<http://www.intel.com/technology/efi/>

# Acronyms

- **RCMP – Remote Management and Control Protocol**  
[http://www.dmtf.org/standards/standard\\_alert.php](http://www.dmtf.org/standards/standard_alert.php)
- **RFC – Request for Comment** <http://www.ietf.org>
- **TCO – Total Cost of Ownership**
- **TCP/IP – Transmission Control/Internet Protocol**  
[www.faqs.org/rfcs/rfc793.html](http://www.faqs.org/rfcs/rfc793.html)
- **TFTP – Trivial File Transfer Protocol**
- **TPM – Trusted Computing Group**  
<http://www.trustedcomputinggroup.org>
- **WBEM – Web-Based Enterprise Management**  
[http://www.dmtf.org/standards/standard\\_wbem.php](http://www.dmtf.org/standards/standard_wbem.php)
- **WfM – Wired for Management**
